

Signal indicator MCL-WS-01

Application:

Signal light MCL-WS-01 consists of a front panel and metal housing.

On the front panel, there are placed neon lights, control slots, and M4 bolts. On the housing in the back of the signal light, there is located connecting block and the earthing bolt M4.

The signal light should be connected to post signal insulators through the cable min. $0,5 \text{ mm}^2$ of dielectric strength 750 V, by connecting the relevant phases with the relevant clamps of the connecting block.

Earthing-wire should be connected with the M4 bolt, in the back of the housing.

The guarantee of a safe and proper operation of the signal are the electrical connections, and especially the quality of the earth-wire connection.
